Figure S3. Path analysis model including the paths SES → FH and SES → Expressive vocabulary 24 m.

The Figure shows standardised estimates of coefficients. Model fit information: Chi-square = 24.80, $df = 15$, $p = .053$; Root mean square error of approximation (RMSEA) = .067, 90% CI = .000-.113; comparative fit-index (CFI) = .952; Standardised Root Mean Square Residuals (SRMR) = .066. Nonsignificant paths are indicated by a dotted line. * $p < .05$; ** $p < .01$; *** $p < .001$
