#### Supplemental Material S1. Detailed analyses.

Figure S1 (below) presents detailed results from the same 5 linguistic production articles summarized in the Results section but broken down into type of linguistic comparison (e.g., modality, lexical, or phrasal) and by type of dependent measure (e.g., percent correct or an acoustic measure).

Observed Outcome

Figure S2 (below) shows individual comparisons from the linguistic comprehension articles broken down by lexical, phrasal, and modality (question, statement, command) distinctions. A RHD advantage is typical, with exceptions.

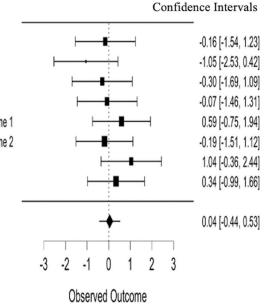

Figure S3 (below) shows individual comparisons from the single emotional production article broken down by task (multiple choice percent correct by judges, intensity ratings by judges) for two time points and for groups with frontal and nonfrontal lesions. Careful examination of the figure shows that the RHD impairment in percent correct got worse from Time 1 to Time 2 for both the Frontal and Nonfrontal sets, as did the intensity measure for the NonFrontal groups. This pattern illustrates the heterogeneity of results observed throughout this literature.

	Observed Outserve	

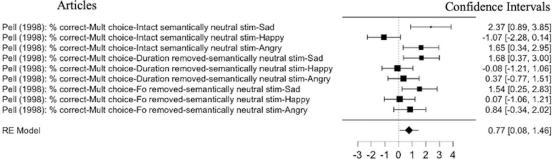

Observed Outcome

Figure S5 shows the results for Pell (1998). Recall that the Pell 1998 effect sizes are not comparable to others due to the author's calculation of standard deviations based on differences across condition means rather than based on differences across individual participants; only the direction of effect is interpretable. In addition, the Pell et al. RHD advantage was less than that for the Linguistic comprehension effects obtained from the same individuals.
